

Product Catalog Structure

Categories, product types, attributes, filters, and users

Prepared for client review - 29 June 2026

This document explains how the catalogue is structured so the client can review whether products are grouped, described, filtered, and sold correctly.

Catalogue Principle

Every sellable item is treated as a product. The product can be a single downloadable resource, a package of resources, or an access plan.

This keeps the catalogue flexible while allowing customers to browse by different needs: grade, term, subject, resource format, or offer type.

Product Types

- Individual Resource: a single downloadable test, assessment, summary, or similar resource.
- Package: a grouped once-off purchase, such as a term package or full-year package. The prototype currently uses the technical label Bundle in some places.
- Access Plan: a premium once-off purchase that unlocks resources for a selected grade and period. The current model supports term or year access periods and does not renew automatically.

Main Product Attributes

- Title and short description.
- Full product description.
- Price.
- Grade.
- Term.
- Year.
- Product type: Individual Resource, Package, or Access Plan.
- Resource format, currently Test / Assessment or Summary.
- Subjects.
- Marks, where relevant.
- Preview files, where available.
- Purchased files.
- Included products for packages and access plans.
- Published and featured status.
- SEO title and description.

Categories and Value Lists

- Grades: Grade 3, Grade 4, Grade 5, Grade 6, and Grade 7.
- Terms: Term 1, Term 2, Term 3, and Term 4.
- Years: the curriculum or release year attached to the product.
- Subjects: managed as catalogue content so products can belong to one or more subjects.
- Resource formats: currently Test / Assessment and Summary, with room to add more later.
- Product types: Individual Resource, Package, and Access Plan.

Filters and Customer Access Points

- Shop filters by search, grade, term, subject, format, and type.
- Grade pages filter the catalogue to one grade and allow term narrowing.
- Packages separates term packages, full-year packages, and access plans.
- Product pages show related resources to keep customers moving through the catalogue.
- The navigation highlights access plans as premium offers.

Customer and Order Records

- Customers: account records used for login, checkout, order history, and downloads.
- Orders: purchase records created during checkout.
- Order items: the products purchased inside an order.
- Payments: payment-provider status and references connected to each order.
- Downloads: files are accessed through order detail pages after payment is confirmed.

Current Interpretation of Packages vs Access Plans

A package appears to be a fixed group of resources sold as a discounted once-off purchase. For example, a term package or full-year package for a grade.

An access plan appears to be a premium once-off purchase that unlocks resources for a selected grade and access period. It is chosen by grade during checkout and is not currently modelled as a recurring subscription.

This difference should be confirmed because it affects naming, pricing, product descriptions, checkout wording, and customer expectations.

Questions for Client

- Should the final customer-facing term be Package rather than Bundle?
- What exactly is included in a full-year package?
- What exactly is included in a yearly access plan?
- Should access plans include future resources added during the access period, or only the resources available at purchase time?
- Should customers be able to buy access plans for more than one grade in one order?
- Are subjects and resource formats complete for launch?
- Do any products require variants, such as language, memo included/not included, or paper 1/paper 2?
